

Whatever is causing your Erectile Dysfunction (ED), THERE IS A SOLUTION!

ORAL MEDICATIONS (PDE-5 inhibitors)

Oral medication is typically the first treatment for ED. Oral medications, or PDE-5 inhibitors, may improve blood flow to the penis and with sexual stimulation, can create an erection.

VACUUM ERECTION DEVICES (VED)

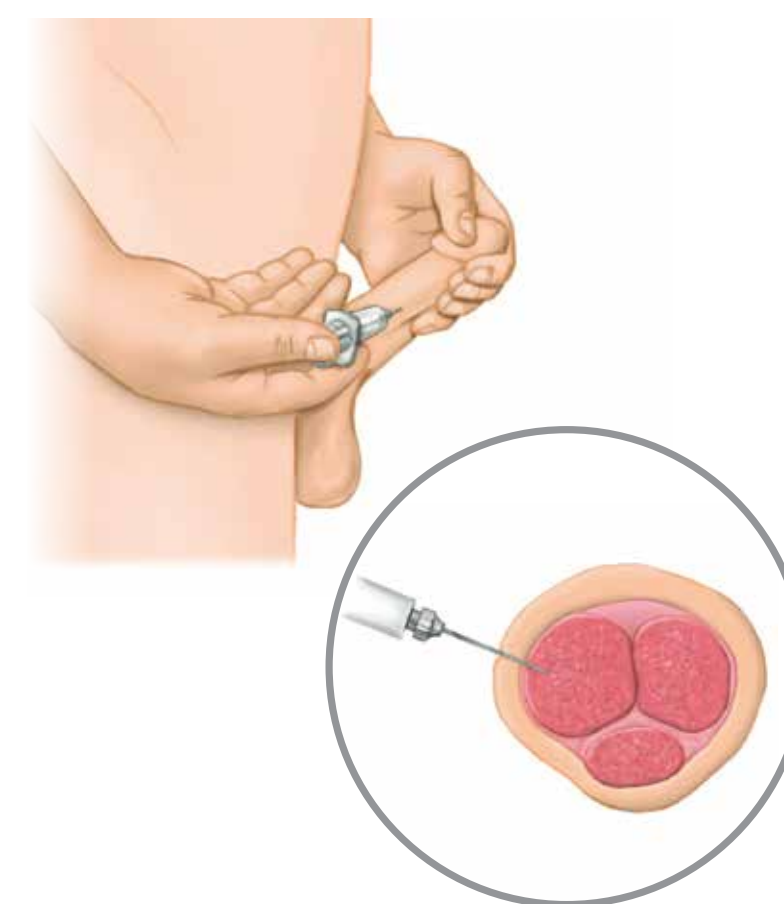

Vacuum draws blood into the corpora cavernosa and a constriction band is placed at the base of the penis to restrict the blood flow out of the penis to retain the erection.

PENILE IMPLANTS

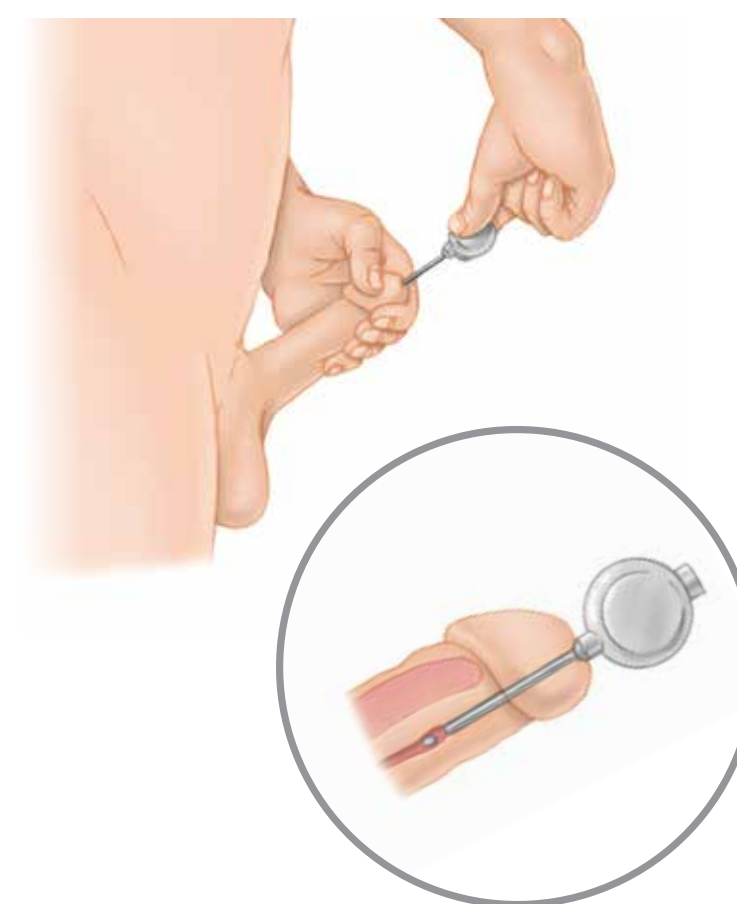

Implants offer a permanent solution to ED. The device is surgically implanted and completely concealed inside the body.

PENILE INJECTION THERAPY

Medication is injected directly into the corpus cavernosum of the penis and creates an erection.

URETHRAL SUPPOSITORIES

Medication in the form of a pellet is inserted into the urethra and increases blood flow to create an erection.
