Platinum Chromium Coronary Stent System

2 DEVICE DESCRIPTION:

REBEL Platinum Chromium Coronary Stent System:
The REBEL Platinum Chromium Coronary Stent System is a device consisting of a balloon expandable stent, pre-mounted on a Monorail (MR) or Over-The-Wire (OTW) delivery catheter. The stent is made from a platinum chromium alloy (PtCr). The characteristics of the REBEL Stent System are described in Table 2.1.

12 HOW SUPPLIED

13 OPERATIONAL INSTRUCTIONS
2.1 Device Component Description

The REBEL™ Stent component is made from a platinum chromium alloy and mounted onto a Monorail® or Over-the-Wire Delivery System.

The REBEL Stent System is available in four stent models, each engineered for specific diameters to provide consistent stent- to-artery ratios across the range of reference vessel diameters indicated:

- Small Vessel (SV): 2.25 mm
- Small Workhorse (SWH): 2.50, 2.75 mm
- Workhorse (WH): 3.00, 3.50 mm
- Large Vessel (LV): 4.00, 4.50 mm

Contents for (1) REBEL Monorail Stent System
- One (1) REBEL Monorail Delivery System
- Two (2) CLUTIP® Colls
- One (1) Flushing needle with luer fitting

Contents for (1) REBEL Over-the-Wire Stent System
- One (1) REBEL Over-the-Wire Stent System

6.5 Stent Handling (also see Section 13, Operational Instructions)

- For single use only. Do not resterilize or reuse this product.
- Note product “Use By” date. (see Section 1, Warning)
- The premounted REBEL stent and its delivery system are designed for use as a unit. The stent is not to be removed from its delivery balloon. The stent is not designed to be crimped onto another balloon. Removing the stent from its delivery balloon may damage the stent and/or lead to stent dislodgment.
- Special care must be taken not to handle or in any way disrupt the stent position on the delivery balloon. This is most important during catheter removal from packaging, placement over guidewire, and advancement through hemostasis valve adapter and guide catheter hub.
- Excessive manipulation or handling may cause stent damage, contamination, or dislodgment of the stent from the delivery balloon.
- Use only the appropriate balloon inflation media (see Section 13.3.3, Delivery System Preparation). DO NOT USE air or any gas medium to inflate the balloon.
- In the event the REBEL stent is not deployed, do not use the product and contact your local Boston Scientific Representative for return information.

6.10 Stent Placement Preparation

- DO NOT PREPARE OR PRE-INFLATE BALLOON PRIOR TO STENT DEPLOYMENT OTHER THAN AS DIRECTED. Use the balloon purging technique described in Section 13.3.3, Delivery System Preparation.
- An unexpanded stent should be introduced into the coronary arteries one time only. An unexpanded stent should not be subsequently moved in and out through the distal end of the guide catheter as stent damage or stent dislodgment from the balloon may occur.

Placement

- The vessel should be pre-dilated with an appropriate sized balloon. Failure to do so may increase the risk of placement difficulty and procedural complications.
- If unusual resistance is felt at any time during lesion access before stent implantation, the stent delivery system and the guide catheter should be removed as a single unit (see Section 6.11, Stent Delivery System Removal – Pre-deployment).
- Do not expand the stent if it is not properly positioned in the vessel (see Section 6.11, Stent Delivery System Removal – Pre-deployment).
- Balloon pressures should be monitored during inflation. Do not exceed rated burst pressure as indicated on product label (Table 13.1, Typical REBEL Stent System Compliance). Use of pressures higher than specified on product label may result in a ruptured balloon and intimus damage and dissection.
- The stent inner diameter should approximate 1.1 times the distal reference diameter of the vessel.
- Placement of the stent has the potential to compromise side branch patency if stenting near a side branch (see Section 13.7, Post-Deployment Dilatation of Stented Segments).
- Implanting a stent may lead to dissection of the vessel distal and/or proximal to the stented portion, and may cause acute closure of the vessel requiring additional intervention (i.e., CABG, another stent dilation, placement of additional stents, or other).
When treating multiple lesions, the distal lesion should generally be stented first, followed by stenting of the more proximal lesion(s). Stenting in this order alleviates the requirement to cross the proximal stent when placing the distal stent and reduces the chances of dislodging the proximal stent.

6.11 Stent Delivery System Removal – Pre-deployment
• If unusual resistance is felt at any time during lesion access before stent implantation, the stent delivery system and the guide catheter should be removed as a single unit under direct visualization using fluoroscopy.
• Do not attempt to pull an unexpanded stent back into the guide catheter, as stent damage or stent dislodgement from the balloon may occur.
• Stent retrieval methods (use of additional wires, snare, and/or forceps) may result in additional trauma to the vascular site. Complications can include bleeding, hematoma, or pseudoaneurysm.

6.12 Stent Delivery System Removal – Post-deployment
• Following stent placement, confirm complete balloon deflation (See Table 6.1, Delivery System Deflation Time Specifications). If greater than usual resistance is felt during delivery system withdrawal, pay particular attention to guide catheter position. In some cases it may be necessary to pull back slightly on the guide catheter in order to prevent deep seating (unplanned advancement) of the guide catheter and subsequent vessel damage. In cases where unplanned guide catheter movement has occurred, angiographic assessment of the coronary tree should be undertaken to ensure that there is no damage to the coronary vasculature.
• Maintain guidewire placement across the lesion during the entire removal process.
• Carefully pull back the stent delivery system until the proximal balloon marker of the stent delivery system is just distal to the guide catheter distal tip.
• The stent delivery system and the guide catheter should be pulled back until the tip of the guide catheter is just distal to the arterial sheath, allowing the guide catheter to straighten. Carefully retract the stent delivery system into the guide catheter and remove the stent delivery system from the patient as a single unit while leaving the guidewire across the lesion.

Note: Failure to follow these steps, and/or applying excessive force to the stent delivery system, can potentially result in stent damage, stent dislodgment from the balloon, and/or damage to the delivery system.

7 OVERVIEW OF CLINICAL STUDIES:
The principal safety and effectiveness for the REBEL™ Stent System is derived from the global OMEGA Clinical Trial, a clinical trial conducted on the OMEGA™ Stent System. The OMEGA and REBEL stents utilize the same platinum chromium alloy. The REBEL Stent System has supplementary proximal stent connectors for increased axial strength, a short flexible stent delivery system tip, and a PTFE coated proximal hypotube for improved stent deliverability. Given the similarities between the OMEGA and REBEL Stent Systems and supportive bench and animal study information, the findings from the OMEGA Clinical Trial are applicable to the REBEL Stent System.

8 ADVERSE EVENTS:
8.1 Observed Adverse Events
Observed adverse event experience comes from the OMEGA Clinical Trial. Major clinical events for this study are shown in Table 8.1.

6.13 Post-Procedural Care
• Care must be exercised when crossing a newly deployed stent with any wire, catheter or ancillary device to avoid disrupting the stent placement, apposition, and/or geometry.
• If the patient requires imaging, see Section 6.8, Magnetic Resonance Imaging (MRI).
8.2 Potential Adverse Events
Potential adverse events (in alphabetical order) which may be associated with the use of a coronary stent in native coronary arteries include but are not limited to:

- Abrupt closure
- Allergic reaction (including to medications, contrast, stent materials)
- Anemia (coronary)
- Angina
- Arrhythmias, including ventricular fibrillation and ventricular tachycardia
- Arteriogenous fistula
- Bleeding
- Cardiac tamponade
- Cardiogenic shock
- Cardiomyopathy
- Death
- Emboli (including air, tissue, thrombus, plaque, or device materials)
- Heart failure
- Hematoma
- Hemorrhage
- Hypotension/hypertension
- Infection, local and/or systemic
- Ischemia, myocardial
- Myocardial infarction
- Pain
- Pericardial effusion
- Pseudoneuropathy, femoral
- Pulmonary edema
- Renal insufficiency or failure
- Respiratory failure
- Restenosis of stented segment
- Shock
- Stent embolization
- Stent fracture
- Stent migration
- Stent thrombosis and/or vessel occlusion
- Stroke/cerebrovascular accident/transient ischemic attack
- Total occlusion of coronary artery
- Vessel spasm
- Vessel injury (including dissection, perforation, rupture or trauma)

There may be other potential adverse events that are unforeseen at this time.

9 CLINICAL STUDIES:

OMEGA Clinical Trial

Primary Objective: To evaluate the safety and effectiveness of the OMEGA™ Coronary Stent System for the treatment of de novo atherosclerotic coronary artery lesions ≤ 28 mm in length (by visual estimate) in a native coronary arteries ≥ 2.25 mm to ≤ 5.00 mm in diameter (by visual estimate).

Design: The OMEGA Clinical Trial is a prospective, single-arm, multicenter study. Eligible patients were to be ≥ 18 years of age and with left ventricular ejection fraction (LVEF) ≥ 30% and symptomatic coronary artery disease or documented silent ischemia. Lesions were to be coverable by a single study stent and to have visually estimated stenosis ≥ 50% and < 100% with Thrombolysis in Myocardial Infarction (TIMI) flow ≥ 3. Patients could have 1 target lesion treated. Patients with a single target lesion could also have de novo native coronary artery lesion within a different epicardial vessel (non-target lesion) treated with a commercially-available treatment (e.g., stent, balloon angioplasty, excluding brachytherapy) during the index procedure. The non-target lesion was not to be treated before the target lesion and the treatment had to be a clinical angiographic success (defined as visually assessed stenosis ≤ 50% ≤ 3 mm for stents) with TIMI 3 flow without prolonged chest pain or electrocardiogram (EGC) changes consistent with MI before the patient could be enrolled. The protocol mandated antiplatelet therapy compliance in accordance with the prolonged chest pain or electrocardiogram [ECG] changes consistent with MI) before the patient success (defined as visually assessed stenosis < 50% (< 30% for stents) with TIMI 3 flow without balloon angioplasty, excluding brachytherapy) during the index procedure. The non-target lesion epicardial vessel (non-target lesion) treated with a commercially-available treatment (e.g., stent, de novo

Baseline characteristics: Baseline lesion characteristics included average reference vessel diameter (RVD) of 2.77±0.53 mm, average minimum lumen diameter (MLD) of 0.90±0.38 mm, average percent diameter stenosis (%DS) of 82.4±11.34, and average lesion length of 12.49±5.15 mm.

Safety

Primary Endpoint (9-Month TLF): The primary endpoint was met. The 9 month TLF rate was 11.5% and the upper 1-sided 95% confidence bound of 14.79% was less than the prespecified P=0.21 (p=0.001). Similar results were found whether the per protocol or the ITT subject populations were analyzed.

Results in Males and Females: OMEGA data were evaluated retrospectively for possible gender-based differences in clinical outcomes. OMEGA was not designed or powered to study safety or effectiveness of the OMEGA Stent in gender-specific subgroups, so these analyses were performed post hoc and are considered hypothesis-generating.

In the OMEGA ITT population, of the 328 enrolled patients, 222 patients were male (67.7%) and 106 patients were female (32.3%). In the United States, an estimated 15.4 million adult women and older (79% of men and 5% of women) suffer from coronary artery disease (CAD). However, it is estimated that only about 33% of the annual PCIs are performed in women. In PCI clinical trials, women represent only 25-30% of the enrolled populations, and there are relatively little gender specific data. The disproportionate enrollment distribution in this trial may be partly attributable to gender differences in pathophysiology, risk factors, and symptoms which may lead to under-diagnosis and under-referral of female patients with CAD. Once diagnosed and treated, poorer revascularization outcomes have been reported in women due to smaller coronary arteries and peripheral vascular disease compared with men.

In patients treated with the OMEGA stent, the 9-month rate of TLF was 12.3% in males and 9.4% in females.

This post hoc analysis shows similar treatment effect between genders for the primary endpoint of 9-month TLF and its components. This suggests that the overall conclusions of the trial regarding both safety and effectiveness of the OMEGA stent can be generalized to males and females.
This trial was not used to determine the rate of low frequency events with a pre-specified precision. The results of the study may be used to estimate the frequency of low frequency events, which may be used to guide further research.

13.9 OMEGA 9-Month Clinical Results for male and female patients. Given the small number of patients enrolled, no conclusions can be drawn from these data.

13.1 Inspection Prior to Use

Do not use the product after the “Use By” date. Carefully inspect the sterile product before opening. If the integrity of sterile package has been compromised prior to the product “Use By” date, contact your local Boston Scientific representative for return information.

13.2 Materials Required (not included in Stent Delivery System package)

- 1 Appropriate arterial sheath
- 1 Pre-deployment dilation catheter
- 1 Three-way stopcock
- 1 Rotating hemostatic valve
- 1 Diluted contrast medium 1:1 with normal heparinized sterile saline
- 1 Inflation Device
- 1 Torque Device
- 1 Definite or Probable
- 1 Definite
- 1 MI
- 1 Q-wave MI
- 1 Non-Q-wave MI
- 1 ARC Stent Thrombosis
- 1 Cardiac Death or MI
- 1 Cardiac Death
- 1 Non-TLR TLR, PCI
- 1 Non-TLR TLR, CABG
- 1 Non-TLR TLR, Overall
- 1 All Death
- 1 TLR, CABG
- 1 TLR, PCI
- 1 TLR, Overall
- 1 TVR, CABG
- 1 TVR, Overall

13.3 Preparation

13.3.1 Packaging Removal

- 1 Open the outer box to reveal the pouch and carefully inspect the pouch for damage.
- 1 Do not use if any defects are noted.
- 1 Do not use the product after the “Use By” date.
- 1 Carefully inspect the sterile package before opening.

10 INDIVIDUALIZATION OF TREATMENT:

The risks and benefits should be carefully considered for each patient before use of the REBEL™ Stent System. Patient selection factors to be assessed should include a judgment regarding risk of prolonged antplatelet therapy. Aspirin should be administered indefinitely. Warfarin is generally avoided in those patients at heightened risk of bleeding (e.g., those patients with recently active ulcer disease) in whom antplatelet therapy would be contraindicated. Premorbid conditions that increase the risk of poor initial results or the risks of emergency referral for bypass surgery (diabetes mellitus, renal failure, and severe obesity) should be reviewed.

11 PATIENT COUNSELING INFORMATION:

Physicians should consider the following in counseling patients about this product:
- Discuss the risks associated with stent placement.
- Discuss the risks/benefits issues for this particular patient.
- Discuss alteration to current lifestyle immediately following the procedure and over the long term.

The following patient materials are available for this product:
- A Patient Information Guide (included in the package and available on-line) which includes both product information and a stent implant card.

• An Angioplasty and Stent Education Guide (available on-line or by request) which includes information on coronary artery disease, the implant procedure, and frequently asked questions.

12 HOW SUPPLIED:

Do not use if package is opened or damaged.

13 OPERATIONAL INSTRUCTIONS:

Do not use if labeling is incomplete or illegible.

Handling and Storage

Store in cool, dry, dark place.

Note: If unusual resistance is felt during product mandrel and stent protector removal, do not use the product and replace with another.

Note: If unusual resistance is felt during product mandrel and stent protector removal, do not use the product and replace with another.

5

13.3 Preparation

13.3.1 Packaging Removal

Step Action

1. Open the outer box to reveal the pouch and carefully inspect the pouch for damage.

2. Carefully peel open the sterile barrier using aseptic techniques and extract the stent delivery system.

3. Carefully remove the stent delivery system from its protective tubing for preparation of the delivery system. When using a Monorail® system, do not bend or kink proximal shaft during removal.

4. Insert the product mandrel and stent protector by grasping the catheter just proximal to the stent (at the proximal balloon bond site), and, with the other hand, grasp the stent protector and gently remove distally.

Note: Care should be taken not to kink or bend the shaft upon application or removal of the CLIPIT® Clip.

13.3.2 Guidewire Lumen Flush

Step Action

1. (Over-The-Wire only) Flush the stent delivery system guidewire lumen with normal heparinized saline through the straight arm of the Y-connector manifold.

2. (Monorail only) Flush the stent delivery system guidewire lumen with normal heparinized saline using the flushing needle supplied for the Monorail delivery system at the distal end.

3. Verify that the stent is positioned between the proximal and distal balloon markers. Check for bends, kinks, and other damage. Do not use if any defects are noted.

Note: Avoid manipulation of the stent during flushing of the guidewire lumen, as this may disrupt the placement of the stent on the balloon.
4. Open stopcock to stent delivery system; pull negative for 15 seconds; release to neutral for contrast fill.
5. Close stopcock to stent delivery system; purge inflation device; syringe of all air.
6. Repeat steps 4 through 6 until all air is expelled. If bubbles persist, do not use product.
7. If a syringe was used, attach a prepared inflation device to stopcock.
8. Open stopcock to stent delivery system.
9. Leave inflation device on neutral pressure.
13.4 Delivery Procedure

Step Action
1. Prepare the vascular access site according to standard PTCA practice.
2. Predilate the lesion/vessel with appropriate diameter balloon.
3. Maintain neutral pressure on inflation device attached to stent delivery system.
4. Backload stent delivery system onto proximal end of guidewire while maintaining guidewire position across target lesion.
5. Fully open rotating hemostatic valve to allow for easy passage of the stent and prevent damage to the stent.
6. Carefully advance the stent delivery system into the hub of the guide catheter. When using a Monorail® stent delivery system be sure to keep the proximal shaft/hypotube straight. Ensure guide catheter stability before advancing the stent delivery system into the coronary artery.

Note: If unusual resistance is felt before the stent exits the guide catheter, do not force passage. Resistance may indicate a problem, and use of excessive force may result in stent damage or stent apposition failure. Maintain guidewire placement across the lesion, and remove the stent delivery system and guide catheter as a single unit.
7. Advance the stent delivery system over the guidewire to target lesion under direct fluoroscopic visualization. Utilize the proximal and distal radiopaque balloon markers as a reference point. If the position of the stent is not optimal, it should be carefully repositioned or removed (see also Precautions – Section 6.11, Stent Delivery System Removal Pre-deployment). The inside edges of the marker bands indicate both the stent edges and balloon shoulders. Expansion of the stent should not be undertaken if the stent is not properly positioned in the target lesion segment of the vessel.

Note: If unusual resistance is felt at any time during lesion access before stent implantation, the stent delivery system and the guide catheter should be removed as a single unit. (See also Precautions – Section 6.11, Stent Delivery System Removal Pre-deployment). Once the stent delivery system has been removed do not re-use.
8. Sufficiently tighten the rotating hemostatic valve. The stent is now ready to be deployed.
13.5 Deployment Procedure

Step Action
1. Under fluoroscopic visualization, inflate the delivery system expanding the stent to a minimum pressure of 11 atm (1117 kPa). Higher pressure may be necessary to optimize stent apposition to the arterial wall. Accepted practice generally targets an initial deployment pressure that would achieve a stent inner diameter of about 1.1 times the reference vessel diameter (see Table 13.1). Balloon pressure must not exceed rated burst pressure of 18 atm (1827 kPa).
2. Maintain inflation pressure for 15-30 seconds for full expansion of the stent.
3. Deflate balloon by pulling negative pressure on inflation device until balloon is fully deflated (see Table 6.1, Delivery System Deflation Time Specifications).
4. Confirm stent position and deployment using standard angiographic techniques. For optimal results, the entire stenosed arterial segment should be covered by the stent. Fluoroscopic visualization during stent expansion should be used in order to properly judge the optimum expanded stent diameter as compared to the proximal and distal coronary artery diameter(s). Optimal expansion requires that the stent be in full contact with the artery wall. Stent wall contact should be verified through routine angiography or intravascular ultrasound (IVUS).
5. If stent sizing/apposition requires optimization, readvance the stent delivery system balloon, or another high-pressure, balloon catheter of the appropriate size, to the stented area using standard angioplasty techniques.
6. Inflate the balloon to the desired pressure while observing under fluoroscopy (refer to product labeling and/or Table 13.1 for compliance chart). Deflate the balloon (see Table 6.1, Delivery System Deflation Time Specifications).
7. If more than one REBEL™ stent is needed to cover the lesion and balloon treated area, it is suggested that, to avoid the potential for gap restenosis, the stents be adequately overlapped. To ensure that there are no gaps between stents, the balloon marker bands of the second REBEL stent should be positioned inside of the deployed stent prior to expansion.
8. Reconfirm stent position(s) and angiographic result. Repeat inflations until optimal stent deployment is achieved.
13.6 Removal Procedure

Step Action
1. Ensure balloon is fully deflated before delivery system withdrawal.
2. Fully open rotating hemostatic valve.
3. While maintaining guidewire position and negative pressure on inflation device, withdraw delivery system.
4. Monorail Catheters may be coiled once and secured using the CLIPIT® Coil Clip (see Section 13.3.1, Packaging Removal).
5. Repeat angiography to assess the stented area. If an adequate expansion has not been obtained, exchange back to the original stent delivery catheter or exchange to another balloon catheter of appropriate balloon diameter to achieve proper stent apposition to the vessel wall.

13.7 Post-Deployment Dilatation of Stented Segments

Precaution: Do not dilate the stent beyond the limits tabulated below.

<table>
<thead>
<tr>
<th>Nominal Stent Diameter (ID)</th>
<th>Dilatation Limits (ID)*</th>
</tr>
</thead>
<tbody>
<tr>
<td>2.25 mm</td>
<td>2.75 mm</td>

<td>4.25 mm</td>
</tr>
<tr>
<td>4.00 mm – 4.50 mm</td>
<td>5.75 mm</td>
</tr>
</tbody>
</table>

*Maximum Stent Inner Diameter

All efforts should be taken to assure that the stent is not under-dilated. If the deployed stent size is still inadequate with respect to vessel diameter, or if full contact with the vessel wall is not achieved, a larger balloon may be used to expand the stent. The stent may be expanded using a low profile and high pressure balloon catheter. If this is required, the stented segment should be recrossed carefully with a prolonged guidewire to avoid dislodging the stent. The balloon should be centered within the stent and should not extend outside of the stented region.
