USING YOUR VERCISE DBS CHARGING SYSTEM
A QUICK START GUIDE FOR PATIENTS AND CAREGIVERS
An Overview of the Charger

Indicator Light

Power
All You Need to Charge Your Rechargeable DBS Stimulator Is:

- The power supply, adapter and base station
- The charger
- The charging collar and accompanying counterweight
1. Charge Your Charger

Plug power adapter into a power outlet and the base station. Place the charger in the base station. A yellow light will appear on the charger. This means the charging is in process.

Please note that as long as the yellow light shows, the charger is only partially charged. This means it can still be used to charge your DBS stimulator but it may not be possible to recharge the stimulator fully.

When a green light shows, the charger is fully charged. This means it is ready to charge your DBS stimulator.

If the indicator light is not showing while the charger is in the base station, there may be a loose connection. Check that the charger is securely placed in the base station.
2. Place the Charger Within Your Charging Collar

Once sufficiently charged, remove the charger from the base station. Before you place your charger in your charging collar, make sure to switch your charger on, using the circular power button in the middle of the charger.

The green indicator light will show and the charger will beep in a steady continuous rhythm. Once the charger is aligned with your stimulator, the beeping will stop.

Place the charger into the pouch of your charging collar and place the counterweight in the opposite pouch.

Place the charging collar around your neck. Make sure the mesh pockets of the collar are facing outwards.
3. Position the Collar to Align the Charger with Your Stimulator

Move the collar slightly up and down and from side to side until it is resting over your stimulator. If you need to, you can change the collar length to the right size. When correctly positioned the continuous single beeps will stop.

Check the charger occasionally to ensure it’s centered over your stimulator. If not centered properly, charging times may vary.

You know the stimulator is fully charged when you hear a double beep for a total of 60 seconds. Although you don’t have to charge your stimulator to 100% it can be helpful to know that your battery is fully charged, especially before attending a programming clinic.

Tip: Once your stimulator is charged, return your charger to the base station. This ensures it will be fully charged for the next time you need it. Then you’re all set!
