

HELP HIM RETURN TO

Robert

Chronic Heart Failure, ON THE JOB

Robert is passionate about woodworking, and he's lucky enough to do it as a career. He's unlucky although, in his heart health. Robert suffered from ischemic-driven heart failure as a by-product of his coronary artery disease. He was constantly tired and experiencing debilitating chest pain. When he first presented with heart failure symptoms at the hospital, Robert received an ICD, but a diagnostic cath was not performed.

Eventually, his symptoms resurfaced. Because Robert has a family to support, and is not quite old enough to retire, he was forced to work day after day in pain. He returned to his physician and received an angiogram to confirm blockage in the LAD. An IC opened the high-risk lesion. Not long after his procedure, Robert was back at work and loving what he did once again.

***I'm enjoying my time at work, in a job I love.
I didn't think I'd have that experience again.***

SYMPTOMS:

Fatigue, angina, dyspnea

RISK FACTORS:

Chronic heart failure, family history of CAD, history of smoking
