LIVE LIKE**

**Linda** **AGAIN**

## **No stranger TO HEART DISEASE**

As a complex, high-risk, indicated patient (CHIP) with one bypass surgery under her belt, Linda is no stranger to heart disease. She's a retiree who enjoys spending time with her family and honing her pottery skills. Or at least she used to. Just two years after her surgery, her fatigue and chest pain symptoms returned, even while on medication. She became too tired for her hobby, and she was often in pain. Linda did not want another surgery.

After determining that her SVGs had failed, Linda's IC referred her to a Complex PCI operator who determined she could be helped without surgery. He opened up her right coronary artery that was 90% occluded. Linda's quality of life has since improved. She has reduced her medications and resumed making pottery for friends and family.

***"I thought my days of pain-free living were over. This procedure changed all that—I feel great and am enjoying my hobbies more than ever."***

### **SYMPTOMS:**

Fatigue, angina

### **CLINICAL RISK FACTORS:**

Chronic obstructive pulmonary disease, severe liver disease
